EDEntered STN: 12 Apr 2006

AB The present application relates to immunogenic compns. comprising staphylococcal poly-N-acetylglucosamine (PNAG)/PIA (polysaccharide intercellular adhesin) and Type 5 and/or 8 capsular polysaccharide or oligosaccharide from Staphylococcus aureus. PNAG (PIA) is highly

conserved among Gram pos. bacteria and provides protection against a broad range of bacteria whereas Type 5 and 8 polysaccharides are potent imunogens that elicit an immune response against most strains of S. aureus which is the most common cause of nosocomial infection. Vaccines, methods of treatment using and processes to make an immunogenic composition comprising PNAG and Type 5 and/or 8 capsular polysaccharides are also described. In other embodiments immunogenic compns. also comprise different combinations of staphylococcal antigens.

EDEntered STN: 12 Apr 2006

AΒ The present application relates to immunogenic compns. and vaccines, their manufacture and the use for the prevention or treatment of staphylococcal disease. More particularly, the invention provides immunogenic compns. or vaccines comprising lipoteichoic acid from Gram-pos. bacterium and Staphylococcus aureus capsular polysaccharides type 5 and/or 8. It also

provides vaccine compns. comprising combinations of staphylococcal antigens which allow a particularly effective immune response to be generated. Examples of such combinations include a iron-regulated protein HarA in combination with further staphylococcal antigens. It was shown that HarA is a particularly effective antigen to be incorporated into a mixture of staphylococcal protein antigens. Provided are protein and gene sequences from S. aureus and S. epidermidis for HarA and other antigens, including extracellular component binding proteins, toxins, transport proteins, regulators of virulence, and structural proteins. Methods for the treatment or prevention of staphylococcal infections using such vaccines are also provided.

ED Entered STN: 23 Feb 2006

AB Materials and methods for producing proteins involved in cell proliferation and apoptosis, particularly proliferation and apoptosis of tumor cells, are provided. Assays for identifying inhibitors of the proteins and methods for producing such inhibitors are also provided, as are methods of treatment using the inhibitors. More specifically, the invention provides HectH9 polypeptides and nucleic acids, agonists and inhibitors thereof, and their use in assays and methods of treatment. The

cDNA sequence and the encoded protein sequence of human HectH9 are disclosed. It was shown that: (i) HectH9 is overexpressed in human tumors, (ii) HectH9 downregulation leads to growth arrest and morphol. changes in HeLa cells, (iii) HectH9 depletion impairs the growth of cancer cells but not primary fibroblasts. Inhibitors of HectH9 expression or activity can be used as anticancer agents.

ED Entered STN: 24 Feb 2005

AB The invention relates to novel binding domain-Ig fusion proteins that feature (1) a binding domain for a cognate structure such as an antigen, a counterreceptor or the like, (2) a wild-type IgG, IgA or IgE hinge-acting region, or a mutant IgG1 hinge region polypeptide having either zero, one or two cysteine residues, and (3) Ig CH2 and CH3 domains. Parent monoclonal antibody Fv single-chain binding moieties include murine 2H7 (anti-human CD20), 40.2.220 (anti-human CD40), 2E12 (anti-human CD28), 10A8 (anti-human CD152/CTLA-4), G19-4 (anti-human CD3), L6 (anti-carcinoma), FC2-2 (anti-CD16), UCHL-1 (anti-CD45RO), HD37 (anti-CD19), G19-4 (anti-CD3), and 5B9 (anti-human 4-1BB/CD137), and rat 1D8 (anti-murine 4-1BB/CD137). The fusion proteins are capable of antibody-dependent cellular cytotoxicity (ADCC) and/or complement-dependent cytotoxicity (CDC) while occurring predominantly as polypeptides that are compromised in their ability to form disulfide-linked multimers. The fusion proteins can be recombinantly

produced at high expression levels. Also provided are related compns. and methods, including cell surface forms of the fusion proteins and immunotherapeutic applications of the fusion proteins and of polynucleotides encoding such fusion proteins.

AB A method for predicting operons in prokaryotes, and particularly in the genome sequence Staphylococcus aureus strain Mu50, is provided. Operon prediction may be used to score the likelihood that adjacent gene pairs whithin a prokaryotic organism's genome are cotranscribed. Gene pairs are identified and segregated into discrete bins indicative of distinct operons on the basis of a calculated score using the consensus operon prediction model. Operon boundaries are identified by comparing the score associated with a selected gene pair with a threshold. The predicted opeons, the genes contained therein, and the associated oeron boundaries may be mapped back to the parokaryotic organism's genome to generate an annotated genomic map for the selected prokaryotic organism. Application to S. aureus demonstrated that >90% of the identified gene pairs were associated with operon prediction scores indicating a high confidence of either being in distinct operons or in the same operon; application of an empirically derived threshold for this organism predicted over 1397 operons (62% monocistronic and 38% polycistronic) from the protein-encoding genes in the S. aureus strain Mu50 genome, a high degree of accuracy when compared with exptl. determined values from the literature. Also described are vectors comprising operons predicted using the this method as well as methods of using antisense nucleic acids complementary to at least a portion of a predicted proliferation-required operon to inhibit cellular proliferation. Methods of using such antisense nucleic acids to sensitize cells for use in assays to identify compds. which possess the ability to inhibit cellular proliferation are also described.

The present invention discloses isolated nucleic acid mols. encoding a AB hyperimmune serum reactive antigen or a fragment thereof as well as hyperimmune serum reactive antigens or fragments thereof from S. agalactiae, methods for isolating such antigens. The hyperimmune serum reactive antigens are useful as vaccines against bacterial infection, especially

infection by S. agalactiae; for raising antibodies (e.g. monoclonal antibodies, antibody fragments, chimeric and humanized antibodies); for screening antagonists; and for diagnosing bacterial infection. Also included in the invention are anticalines, aptamers and spiegelmers, and functional RNA comprising ribozymes, antisense nucleic acids and siRNA.

ED Entered STN: 29 Oct 2004

The invention relates to cultures or collections of strains which AB overexpress or underexpress gene products required for the proliferation of an organism. The invention also includes methods for identifying the target on which a compound which inhibits the proliferation of an organism acts and methods for identifying the extent to which a strain is present in a culture or collection of strains. Thus, a culture is obtained comrpising a plurality of strains wherein each strain overexpresses a

different gene product which is essential for prolifeation. The culture is contacted with a sufficient concentration of an agent to inhibit th eproliferation of strains which do not overexpress the gene product on which the agent acts, such that strains which overexpress the gene product on which the agent acts proliferate more rapidly than strains which do not overexpress said gene product on which the agent acts. The gene product which is overexpressed in a strain which proliferates more rapidly in the culture is then identified. Expression levels of gene transcripts are determined using hybridization and/or amplification methods standard to the

art.

F.G. 22 -5-

Genes required for cellular proliferation of microbial organisms are identified by antisense RNA technol. Nucleotide sequences are provided for nucleic acid fragments whose expression results in detrimental effects on proliferation of Escherichia coli, Staphylococcus aureus, Salmonella typhimurium, Klebsiella pneumoniae, Pseudomonas aeruginosa, or Enterococcus faecalis. [This abstract record is one of three records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.].

ED Entered STN: 29 Oct 2004

AB The invention relates to cultures or collections of strains which overexpress or underexpress gene products required for the proliferation of an organism. The invention also includes methods for identifying the target on which a compound which inhibits the proliferation of an organism acts and methods for identifying the extent to which a strain is present in a culture or collection of strains. Thus, a culture is obtained comrpising a plurality of strains wherein each strain overexpresses a different gene product which is essential for prolifeation. The culture is contacted with a sufficient concentration of an agent to inhibit th eproliferation of strains which do not overexpress the gene product on which the agent acts, such that strains which overexpress the gene product on which the agent acts proliferate more rapidly than strains which do not overexpress said gene product on which the agent acts. The gene product which is overexpressed in a strain which proliferates more rapidly in the culture is then identified. Expression levels of gene transcripts are determined using hybridization and/or amplification methods standard to the

Genes required for cellular proliferation of microbial organisms are identified by antisense RNA technol. Nucleotide sequences are provided for nucleic acid fragments whose expression results in detrimental effects on proliferation of Escherichia coli, Staphylococcus aureus, Salmonella typhimurium, Klebsiella pneumoniae, Pseudomonas aeruginosa, or Enterococcus faecalis. [This abstract record is one of three records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.].

ED Entered STN: 07 May 2004

AB The present invention provides polynucleotides encoding NF-κB-associated polypeptides, fragments and homologs thereof. The polynucleotides and polypeptides were identified based upon their differential expression upon the administration of a known NF-κB peptide inhibitor, and are believed to represent either direct, or indirect, participating members of the NF-κB pathway. Also provided are vectors, host cells, antibodies, and recombinant and synthetic methods for producing said polypeptides. The invention further relates to diagnostic and therapeutic methods for applying these NF-κB-associated polypeptides to the diagnosis, treatment, and/or prevention of various diseases and/or disorders related to these polypeptides. The invention further relates to screening methods for identifying agonists and antagonists of the polynucleotides and polypeptides of the present invention.

The invention provides 1231 novel cDNAs isolated from human tissues, and their encoded polypeptides, related nucleic acid and polypeptide compns., and related modulators, such as antibodies and small mol. modulators. The invention also provides methods to make and use these polynucleotides, polypeptides, related compns., and modulators. These methods include diagnostic, prophylactic, and therapeutic applications. The compns. and methods of the invention are useful in treating proliferative disorders, e.g., cancers, and inflammatory, immune, bacterial, and viral disorders.

AB A Bacillus licheniformis mutant host cell derived from a parent B. licheniformis host cell is provided in which the mutant host cell is mutated in one or more gene(s) encoding one or more of 122 secreted polypeptide(s). The mutant host cell secretes ≥5% less of the one or more secreted polypeptide(s) than the parent host cell, when they are cultivated under comparable conditions. This reduces the necessary product purification required when producing heterologous products of interest in a B. licheniformis host cell. Production in a mutant host cell of the invention provides a culture medium with far fewer contaminants, and this in turn makes it much easier to purify the product of interest from the culture medium to the point where certain previously required steps may be completely eliminated from the production process. A vector and protocols are designed to allow deletion of the entire open reading frame of the gene encoding a small extracellular protein from B. licheniformis.

The present invention relates to DNA products which are of nature B2+ A-, AB isolated from Escherichia coli, and to their biol. applications, in particular their medical (therapeutic, vaccine and diagnostic) and biotechnol. applications. In the present application, the expression "of nature B2+ A-" is intended to mean presence at a frequency greater than 10% among the E. coli strains of group B2 of the ECOR collection, and at a frequency of less than 10% among the strains of group A of the same collection. Libraries of DNA fragments of the strain C5 of group B2, which are not found in the genome of E. coli of group A (ECOR4 and ECOR15), were produced using the techniques of subtractive hybridization and representational difference anal. These fragments make up genes which participate specifically in the systemic and non-diarrheal extra-intestinal development of E. coli in humans and animals. These fragments and the genes which bear them can be used as active principles (in the form of naked DNA placed under the control of a eukaryotic promoter or in the form of DNA transfected into a cell) in a vaccine composition intended to prevent, alleviate, or combat the systemic and non-diarrheal development of E. coli in a human or animal extra-intestinal compartment. A phylogenic determination PCR method which makes it possible to rapidly and easily distinguish the groups A, B1, B2 and D of the E. coli species with >99% precision is in particular described. Using two genes, chuA and yjaA, and a novel DNA fragment named TspE4.C2, the phylogenic groups of 220 strains which had previously been assigned to phylogenic groups determined using known methods were determined IT

Entered STN: 18 Jul 2003 ED

The present invention relates to novel methods for detecting remote AB polypeptide homologs comprising anal. of conserved secondary structure pattern in a protein family, and conserved active site amino acid residues. The anal. are used to identify conserved residues embedded into the secondary structure pattern (CRISSP), which are used to detect remote homologs of the referent protein family. The present invention also relates to human protein kinases and protein kinase-like enzymes, nucleotide sequences encoding the protein kinase polypeptides, as well as various products and methods useful for the diagnosis and treatment of various protein kinase-related diseases and conditions. The CRISSP method has been applied to the human genome database and 87 novel kinase sequences have been identified. The partial or complete sequences of these kinases are provided together with their classification, predicted protein structure, and encoding nucleotide sequences. Through the use of a bioinformatics strategy, mammalian protein kinases have been identified and their protein structure predicted.

AB The invention provides 3654 polypeptide and 3654 nucleic acid sequences derived from Enterococcus faecium that are useful in diagnosis and therapy of pathol. conditions, antibodies against the polypeptides, and methods for the production of the polypeptides. The invention also provides methods for the detection, prevention, and treatment of pathol. conditions resulting from bacterial infection. [This abstract record is one of two records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.].

The invention provides methods for modulating cytokine levels, GM-CSF levels and the immune system using CD83 nucleic acids, CD83 polypeptides, anti-CD83 antibodies and factors that influence CD83 activity or expression. The invention also provides mice having a mutant CD83 gene and mice having a transgenic CD83 gene, which are useful for defining the role of CD83 in the immune system and for identifying compds. that can modulate CD83 and the immune system.

The invention provides 4126 nucleic acid sequences derived from a genomic AB library of Acinetobacter baumannii strain 15839, as well as the derived open reading frames and protein-coding sequences. These sequences are useful in diagnosis and therapy of pathol. conditions; antibodies against the polypeptides; and methods for the production of the polypeptides. The invention also provides methods for the detection, prevention and treatment of pathol. conditions resulting from bacterial infection. abstract record is one of 2 records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.].

ED Entered STN: 16 Dec 2002

The nearly complete sequence of the genome of Streptococcus agalactiae strain CIP 8245 (ATCC 12403) was determined by shotgun sequencing. The 2.2-Mb chromosome is represented by 138 contigs, and a plasmid genome comprising 45 kbp by a single contig. Addnl., the sequences of 2205 proteins encoded by open reading frames within the genome are provided. Characterization of the genome and its encoded proteome provide the basis for detection and/or amplification of Streptococcus bacteria, and in particular S. agalactiae, cloning and expression vectors for genetic transformation, antibodies for use in immunoassays of Streptococcus bacteria, and development of pharmaceuticals and/or vaccines for inhibition of S. agalactiae infection of animals or humans.

ED Entered STN: 14 Oct 2002

AΒ

The sequences of antisense nucleic acids which inhibit the proliferation of prokaryotes are disclosed. Thus, 6213 nucleic acid fragments are identified for which expression inhibits proliferation or is required for proliferation in Enterococcus faecalis, Escherichia coli, Klebsiella pneumoniae, Pseudomonas aeruginosa, Salmonella typhimurium, and Staphylococcus aureus. Cell-based assays which employ the antisense nucleic acids to identify and develop antibiotics are also disclosed. antisense nucleic acids can also be used to identify proteins required for proliferation, express these proteins or portions thereof, obtain antibodies capable of specifically binding to the expressed proteins, and to use those expressed proteins as a screen to isolate candidate mols. for rational drug discovery programs. The nucleic acids can also be used to screen for homologous nucleic acids that are required for proliferation in cells other than Staphylococcus aureus, Salmonella typhimurium, Klebsiella pneumoniae, and Pseudomonas aeruginosa. The invention provides 38,184 such proliferation-required gene sequences (plus their encoded protein sequences). The nucleic acids of the present invention can also be used in various assay systems to screen for proliferation required genes in other organisms. [This abstract record is one of twenty records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.]. 477132-31-3 477134-44-4

ED Entered STN: 14 Oct 2002

The sequences of antisense nucleic acids which inhibit the proliferation AR of prokaryotes are disclosed. Thus, 6213 nucleic acid fragments are identified for which expression inhibits proliferation or is required for proliferation in Enterococcus faecalis, Escherichia coli, Klebsiella pneumoniae, Pseudomonas aeruginosa, Salmonella typhimurium, and Staphylococcus aureus. Cell-based assays which employ the antisense nucleic acids to identify and develop antibiotics are also disclosed. antisense nucleic acids can also be used to identify proteins required for proliferation, express these proteins or portions thereof, obtain antibodies capable of specifically binding to the expressed proteins, and to use those expressed proteins as a screen to isolate candidate mols. for rational drug discovery programs. The nucleic acids can also be used to screen for homologous nucleic acids that are required for proliferation in cells other than Staphylococcus aureus, Salmonella typhimurium, Klebsiella pneumoniae, and Pseudomonas aeruginosa. The invention provides 38,184 such proliferation-required gene sequences (plus their encoded protein sequences). The nucleic acids of the present invention can also be used in various assay systems to screen for proliferation required genes in other organisms. [This abstract record is one of twenty records for this document necessitated by the large number of index entries required to fully index the document and publication system constraints.].

Entered STN: 27 Sep 2002 ED

The present invention is directed to a method of selection of purified AB nucleotide sequences or polynucleotides encoding proteins or part of proteins carrying at least an essential function for the survival or the virulence of mycobacterium species. The method comprises first aligning the genomic sequence of a first mycobacterium species on a genomic sequence of a second mycobacterium species. Then select a polynucleotide sequence highly conserved in both genomes with no counterparts in other bacterial genomic sequences and which corresponds to an essential gene for the survival or the virulence of the mycobacterium species. Optionally, the selected polynucleotide may be tested for its capacity of virulence or involvement in survival based on the activation or inactivation of said polynucleotide in a bacterial host, or testing being based on the activity of the product of expression of the polynucleotide in vivo or in vitro. This comparative genomic anal. is demonstrated with the genome of M. tuberculosis aligned on the genome sequence of M. leprae. Six hundred forty-four M. tuberculosis and M. leprae marker polypeptides are identified. The proteins are of use in diagnostic detection of infection by mycobacteria using standard electrophoresis or immunoassay techniques. IT461750-67-4

Entered STN: 04 Oct 2002 ED

The invention provides methods of screening commensal and pathogenic AB bacteria for previously unidentified vaccine antigens, based upon identifying polypeptide antigens that bind to sera raised against commensal bacterial proteins. Also provided are vaccine compns. and methods of preparing vaccine compns. comprising the antigens identified by the screening methods. Antigens and uses thereof are also described.

ED Entered STN: 02 Aug 2002

Described is a method for identification, isolation and production of AB hyperimmune serum-reactive antigens from a specific pathogen, a tumor, an allergen or a tissue or host prone to autoimmunity that are suited for use as vaccines for treating related diseases in animals or humans. The method is characterized by providing an antibody preparation from a plasma pool of said given type of animal or from a human plasma pool or individual sera with antibodies against said specific pathogen, tumor, allergen or tissue or host prone to auto-immunity; providing at least one expression library of said specific pathogen, tumor, allergen or tissue or host prone to auto-immunity; screening said at least one expression library with said antibody preparation; identifying antigens which bind in said screening to antibodies in said antibody preparation; screening the identified antigens with individual antibody prepns. from individual sera from individuals with antibodies against said specific pathogen, tumor, allergen or tissue or host prone to auto-immunity; identifying the hyperimmune serum-reactive antigen portion of said identified antigens and which hyperimmune serum-reactive antigens bind to a relevant portion of said individual antibody prepns. from said individual sera; and optionally isolating said hyperimmune serum-reactive antigens and producing said hyperimmune serum-reactive antigens by chemical or recombinant methods.

IT 445315-39-9P

RL: BPN (Biosynthetic preparation); BSU (Biological study, unclassified); PRP (Properties); BIOL (Biological study); PREP (Preparation) (amino acid sequence; hyperimmune serum-reactive antigens derived from expression libraries for treating or preventing pathogen infection, cancer, allergy, and autoimmune disease)

    Entered STN: 02 Aug 2002
ED
    The present invention pertains to a novel microorganism of the genus
AB
    Bifidobacterium longum, in particular to its genomic sequence and the
    nucleotide sequences encoding polypeptides of Bifidobacterium NCC2705
     (CNCM I-2618), which are secreted or specific or which are involved in the
    metabolism, in the replication process, and to polypeptides encoded by such
    sequences as well as to vectors including the said sequences and cells or
    non-human animals transformed with these nucleotide sequences and vectors,
    resp. The chromosomal genome of B. longum NCC2705 comprises 2,256,628
    base pairs. The invention also relates to 1997 transcriptional gene
    products of the Bifidobacterium genome and to methods of detecting these
    nucleic acids or polypeptides. The invention eventually comprises a data
    carrier comprising the nucleotide sequence and/or polypeptide sequence of
    NCC2705 and also pertains to food and pharmaceutical compns. containing said
    microorganism for the prevention and/or treatment of diarrhea brought
    about by rotaviruses and pathogenic bacteria containing said Bifidobacterium.

ED Entered STN: 14 May 2002

AB The invention provides proteins from group B streptococcus (Streptococcus agalactiae) and group A streptococcus (Streptococcus pyogenes), including amino acid sequences and the corresponding nucleotide sequences. The nucleotide sequence of the full genome of S. agalactiae strain 2603 V/R is provided as are 5483 protein-coding genes and the amino acid sequences of their protein products. Data are given to show that the proteins are useful antigens for vaccines, immunogenic compns., and/or diagnostics. The proteins are also targets for antibiotics to treat or prevent bacterial infection, and in particular, streptococcal infection. [This abstract record is one of three records for this document necessitated by the large number of index entries required to fully index the document and publication constraints.].

ED Entered STN: 28 Sep 2001

Genes required for proliferation of Staphylococcus aureus, Salmonella AB typhimurium, Klebsiella pneumoniae, Pseudomonas aeruginosa, and Enterococcus faecalis. Libraries of genomic fragments were operably cloned into vectors comprising inducible promoters in the antisense orientation, and selected for those genes which which fail to grow or grow at a substantially reduced rate when the promoter is induced. The sequences of antisense nucleic acids which inhibit the proliferation of prokaryotes are disclosed. Cell-based assays which employ the antisense nucleic acids to identify and develop antibiotics are also disclosed. The antisense nucleic acids can also be used to identify proteins required for proliferation, express these proteins or portions thereof, obtain antibodies capable of specifically binding to the expressed proteins, and to use those expressed proteins as a screen to isolate candidate mols. for rational drug discovery programs. The nucleic acids can also be used to screen for homologous nucleic acids that are required for proliferation in cells other than Staphylococcus aureus, Salmonella typhimurium, Klebsiella pneumoniae, and Pseudomonas aeruginosa. The nucleic acids of the present invention can also be used in various assay systems to screen for proliferation required genes in other organisms.

The present invention relates to products which are of nature B2+ A-, AB isolated from E. coli, and to their biol. applications, in particular their medical (therapeutic, vaccine and diagnostic) and biotechnol. applications. Subtractive hybridization of group B2 E. coli (strain C5 associated with neonatal meningitis) from that of E. coli strains of group A (nonpathogenic strains ECOR4 and ECOR15) yielded libraries of DNA fragments of C5+A- clones with inserts ranging from 100 to 500 bp long. Sequencing of 494 clones yielded 259 clones which are different from each other and which exhibit no significant homol. with E. coli K12; 153 of these clones are novel as products and the other fragments exhibit homol. with known products. The polynucleotides are useful for medical applications in neonatal meningitis and extra-intestinal infections by E. coli, as well as in animal models for studying E. coli virulence. A PCR method was also developed for rapidly determining the phylogenic group (A, B1, B2 and D) of E. coli strains with >99% precision, based on the chuA and yjaA genes and a novel DNA fragment named TspE4.C2. Subtractive hybridization DNA fragment libraries are also provided for strain CFT073 subtracted from strain K12, as well as for strain RS218+/K12-.

The use of an enzyme found in fungi, bacteria, insects, nematodes, worms, AB mites, protozoa etc. as a target in a screening assay is described by means of which agents capable of inhibiting the function of that enzyme may be identified. The screening assay may include complete cell or purified-enzyme assays. In particular, the present invention relates to a screening assay for inhibitors or suppressors of sugar alc. phosphatases or sugar phosphatases, and more in particular inhibitors or suppressors of trehalose-6-phosphate phosphatase, as well as prepns., in particular, pharmaceutical prepns., which include inhibitors or suppressors obtained from the screening assay. Inhibitors are described as well as applications in biocides and antifungal pharmaceuticals.

A method for identifying suitable targets for antibacterial agents based AB on identifying targets of bacteriophage-encoded proteins is described. Also described are compns. useful in the identification methods and in inhibiting bacterial growth, and methods for preparing and using such compns. These methods and compns. are based on the nucleotide sequences of the genomes of Staphylococcus aureus bacteriophages 77, 3A, 96, and 44AHJD; Enterococcus bacteriophage 182; and Streptococcus pneumoniae bacteriophage Dp-1. Individual open reading frames (ORFs) and the deduced amino acids sequences of their protein products are also provided.
